

ABSTRACT OF THE DISCLOSURE

A circular table includes a table board, and two opposite support units each foldably mounted on the table board. Each of the two support units includes a support stand pivotally mounted on one of two ends of the table board, and a support member pivotally mounted on a mediate of the table board and pivotally connected with the support stand. Thus, the two support units are expanded outward rapidly to support the table board rigidly and stably, thereby facilitating the user expanding the circular table. In addition, the support units are folded in the receiving space of the table board to fold the circular table when not in use, thereby saving space of storage, package and transportation.
